Subject: Letter the Administrator Wheeler on PFAS in pesticides

Dear Administrator Wheeler, please find the attached letter to you on PEER's finding of PFAS in a commonly used pesticide, and a copy of our letter to Mass DEP.

Thank you for your attention to this matter.

Tim Whitehouse

RE: PFAS in Anvil 10+10

Dear Commissioner Suuberg,

Public Employees for Environmental Responsibility (PEER) has been working on perand polyfluoroalkyl substances (PFAS) issues in Massachusetts for several years. We are client-driven, only taking cases brought to us by public employees working in environmental and health agencies, and our PFAS work has grown to include testing of commercial products, water, food, and other items, both in Massachusetts, and in other states around the country.

This fall, PEER conducted several tests for PFAS of a 2.5 gallon jug of Anvil 10+10, the pesticide used in the aerial spraying programs of Massachusetts and many other states. Our tests revealed that Anvil 10+10 contains roughly 250 parts per trillion (ppt) of perfluorooctanoic acid (PFOA), and 260 – 500 ppt of hexafluoropropylene oxide dimer acid (HFPO-DA), a GenX replacement for PFOA. Both these results are hovering around the detection limits of the laboratory's equipment, but there is no doubt that these PFAS are in the insecticide. While PFAS may be useful when added to pesticides as surfactants, dispersants, and anti-foaming agents, it is unclear whether the PFAS found in Anvil 10+10 is an ingredient added by the manufacturer, contained in one of the ingredients supplied to Anvil's manufacturer by other companies, or whether it is a contaminant from the manufacturing/storage process. Moreover, since we were only able to test for 36 PFAS out of the 9,252 on the U.S. Environmental Protection Agency's (EPA's) inventory, it is impossible to know how many other PFAS might be in Anvil 10+10.

Last month, your staff at Massachusetts Department of Environmental Protection (MADEP) issued a rule regulating PFAS in drinking water. DEP's Maximum Contaminant Limit (MCL) is one of the strictest in the nation, and PEER is extremely supportive of the work your agency has been doing to protect the Commonwealth's citizens from these ubiquitous contaminants. As you are aware, PFAS are called "forever chemicals" since they do not break down in the environment and build up in our blood stream. They are associated with a variety of ailments, including suppressed immune function, thyroid disease, testicular and kidney disease, cancers, and liver damage.

Many Massachusetts communities are struggling to find the funds to filter PFAS from their water supplies. The vast majority of these cities and towns do not know where the PFAS is coming from, as they have no Department of Defense facilities, industry, or fire-fighting training facilities nearby. While it is likely some of the contamination is coming from wastewater treatment plants (WWTPs) and consumer goods, it is also possible that some of the widespread contamination is coming from Massachusetts' aerial and ground-based spraying of Anvil 10+10. While PEER concedes it does not know how much of the PFAS in Anvil 10+10 is contaminating our water supplies, groundwater and soils, common sense dictates that it is a factor. In 2019, Massachusetts aerially sprayed 2.2 million acres of the state with Anvil 10+10, and, in 2020, sprayed more than 200,000 acres. Many more acres were sprayed from trucks, and Anvil 10+10 is also used in some home misting systems. Therefore, the potential for PFAS from Anvil 10+10 reaching our waters is high.

It is important to note that these PFAS are not listed as active ingredients in Anvil 10+10. PEER found a number of PFAS listed as approved inert ingredients on EPA's "Inert Finder" database, but PFOA and HFPO-DA do not appear to be approved ingredients. However, PEER also found several patents showing chemical companies using PFAS in both herbicides and insecticides, and recent peer-reviewed articles discuss the variety of pesticides that contain PFAS as either an active or an inert ingredient. Therefore, it is possible that other pesticides also contain PFAS, unbeknownst to DEP or the public.

Pesticide manufacturers usually withhold information from the public about inert ingredients as "trade secrets" or "proprietary" information. Therefore, it is conceivable that PFAS are added deliberately to pesticide formulations. Contrary to its self-congratulatory press releases, EPA has not taken PFAS contamination seriously, leaving states like Massachusetts to deal with a crisis that is not of their own making.

When PEER obtained its first positive PFAS results on Anvil 10+10, we immediately contacted DEP because of the far-reaching implications. MADEP independently tested nine samples of Anvil 10+10 from five different containers, and found eight different PFAS, including PFOA and PFOS. Some PFAS levels were over 700 ppt. As such, there appears to be no doubt that there are PFAS in the pesticide Massachusetts has chosen for mosquito control.

Given the widespread PFAS contamination throughout Massachusetts, PEER requests that DEP:

- Cease the use of Anvil 10+10 unless it can be sure that it does not contain any PFAS;
- Ensure that any pesticide used to replace Anvil 10+10 does not contain any PFAS; and
- Require pesticide companies to provide comprehensive tests of their products showing the absence of fluorinated chemistry before the Commonwealth allows the sale or use of such pesticides.

It is very possible that Massachusetts will have another outbreak of Eastern Equine Encephalitis (EEE) in the summer of 2021. As such, we hope that MADEP will be able to address this issue prior to using any other pesticide to combat mosquito-borne diseases.

PEER is grateful for MADEP's work on the PFAS contamination issue, and we are happy to assist MADEP in any way we can. Please do not hesitate to contact me if you have any questions.

Sincerely,

Tim Whitehouse

Washington, DC 20460

Dear Administrator Wheeler,

We are writing to inform you that tests ordered by Public Employees for Environmental Responsibility (PEER) have found per-and polyfluoralkyl substances (PFAS) in the pesticide Anvil 10 + 10. PEER had these tests conducted because of concern about the use of PFAS in pesticides and herbicides as a surfactant, dispersant and anti-foaming agent, based on our review of scientific literature and patents, and our discussion with experts in the field.

Our tests revealed that Anvil 10+10 contains roughly 250 parts per trillion (ppt) of perfluorooctanoic acid (PFOA), and 260 – 500 ppt of hexafluoropropylene oxide dimer acid (HFPO-DA), a GenX replacement for PFOA. PEER alerted Massachusetts Department of Environmental Protection (MADEP) to its results, and MADEP independently tested nine samples of Anvil 10+10 from five different containers, and found eight different PFAS, including PFOA and PFOS. Some PFAS levels were over 700 ppt. Based on these results, we are requesting that EPA immediately ask all manufacturers of pesticides and herbicides and their adjuvants to self-disclose to EPA whether they use PFAS in their products or in their manufacturing processes. We are also asking EPA to immediately develop a regime to test different pesticides and herbicides on the market for PFAS and make those findings public. Finally, we are asking EPA to release to the public any information they already have about registered pesticides with any kind of PFAS as an active or inert ingredient.

The attached letter to Martin Suuberg, Commissioner, Department of Environmental Protection, Commonwealth of Massachusetts, provides more details about our work in Massachusetts on Anvil 10+10.

It is unclear whether the PFAS found in Anvil 10+10 is an ingredient added by the manufacturer, contained in one of the ingredients supplied to Anvil's manufacturer by other companies, or a contaminant from the manufacturing or storage process. Moreover, since we only tested for 36 PFAS out of the 9,252 on the U.S. Environmental Protection Agency's (EPA's) inventory, it is impossible to know if other PFAS might be in Anvil 10+10. However, it is worth noting that EPA's list of approved inerts for pesticides contain several PFAS, and these chemicals should be withdrawn from approval immediately.

This is a significant environmental issue. PFAS are associated with liver damage, thyroid disease, developmental issues, reduced fertility, high cholesterol, obesity, hormone suppression and cancer. It is nonsensical to deliberately spray millions of acres with PFAS-contaminated pesticides, at the same time that states are grappling with developing regulatory limits for PFAS and cleaning up contaminated drinking water.

Your prompt response to this request is greatly appreciated.

Sincerely,

Tim Whitehouse

Executive Director
